Analysis of productivity drivers and trends, revealing several insights into Medical software development

1. There is a wide variation in performance between the top & bottom quartiles. The top performers have a significant advantage.

2. Complexity (and therefore effort) to develop medical SW has been increasing since 2006, but productivity has remained flat.

3. ~70% of projects experience delays and SW deliveries have been taking longer over the past decade, but product quality continues to improve.

4. R&D footprint needs to be carefully managed as increases in team size and number of R&D sites negatively affects productivity.

5. Software quality, measured by known defect density at release, achieved by medical device companies exceed others by ~17%.

6. Medical product requirements are increasingly hard to nail down. Time to define requirements has increased 29% and unplanned requirements churn has increased 81%.

7. Reuse significantly improves the quality of software developed for medical applications.

8. ~70% of medical products are delivered late. Those delivered “on-time” reuse 22% more code & focus more on new rather than legacy tests.

9. Adding 3rd party SW suppliers increases schedule slip, lowers product quality, and offers only minimal improvement in productivity.

Complexity (and therefore effort) to develop medical SW has been increasing since 2006, but productivity has remained flat.

- Both the complexity of the average medical SW project and the average total effort required have increased ~30% CAGR in the last decade.
- Productivity over the same period has been relatively flat, rising only ~2% CAGR.
- This trend is driven by product differentiation being increasingly in software as well as the introduction of cloud-based, holistic solutions.

R&D footprint needs to be carefully managed as increases in team size and number of R&D sites negatively affects productivity.

- Distributing development across more R&D sites (~11% per year increase in sites) is a reflection of increased complexity and larger teams.
- Fragmenting development across multiple locations introduces inefficiencies associated with (for example) time zones, cultures, communication & collaboration issues, etc.
- The result is a drop of ~11% per site in productivity of medical software teams.

- **2008-2011**: 1.16
- **2012-2015**: 0.72

- Medical products are delivered with 17% fewer known residual defects (vs. non-medical software).
- Moreover, the outgoing SW quality levels in the health care industry have been steadily improving over the past decade.

**SOURCE:** 133 medical projects in the Numetrics SW industry database
Medical product requirements are increasingly hard to nail down. The time to define requirements has increased 29% and the unplanned churn in requirements has increased 81%.

Prior to 2010, the average length of time to finalize medical SW requirements was 20 weeks. Since then, duration of this phase has increased by 29%.

34% of medical requirements experience some kind of churn during development; i.e. they are added, modified or deleted after the 1st release of the functional requirements.

Requirements volatility partly explains the increase in development duration and highlights the need for medical solution providers to invest in managing market and regulatory requirements.

SOURCE: 133 medical projects in the Numetrics SW industry database
Reuse significantly improves the quality of software developed for medical applications.

What is the impact on SW quality due to reuse?

Residual Defect Density

Defects per thousand lines of new or modified code

- Increasing reuse leverage is one of the most powerful ways to improve the quality of the software released.
- For example, increasing reuse leverage from 10% to 20% is associated with a 37% reduction in average residual defect density.
- Reuse leverage is a normalized metric that measures the % of software complexity that is avoided due to reuse of requirements, code and test cases.

SOURCE: 133 medical projects in the Numetrics SW industry database
~70% of medical products are delivered late. Those delivered “on-time” reuse 22% more code & focus more on new rather than legacy tests.

- The average schedule overrun for medical products is 25%.
- The 31% of medical products delivered on-time implement new features using 22% more reused code, minimizing the introduction of new defects.
- The “on-time” projects focus on developing new tests rather than depending on legacy tests (regression) to validate new features. “On-time” projects use 25% fewer reused tests in their test plans.

**SOURCE:** 133 medical projects in the Numetrics SW industry database
Adding 3rd party SW suppliers increases schedule slip, lowers product quality, and offers only minimal improvement in productivity.

- Working with external SW providers can be a way to accelerate deliveries of new features, or reduce internal R&D overhead.
- However, when medical companies work with software suppliers, unplanned schedule slip more than doubles and average residual defect density grows substantially.
- Average development productivity remains relatively flat, independent of the number of suppliers.

– Former principal software engineer, leading medical devices company (ICD devices)

“Too often developers write the tests based on what the code does as opposed to what it is supposed to do. If you don’t define test inputs based on what the real system parameters should be, then you can even get 100% MCDC without actually testing your software”

Numetrics offers performance benchmarking, root cause analysis and project planning (predictive analytics) for SW and IC development.

**What is Numetrics?**

**SaaS-based** R&D predictive analytics platform based on a **patented complexity algorithm** to provide:

- **Performance benchmarking**
- **Root cause analysis**
- **Project planning**

**Where can Numetrics be applied?**

- **Software (Embedded and application):**
  - **Verticals**: Telecom, Financial, Medical devices, Industrial controls, Aerospace & Defense, etc.
  - **Operating systems**: Android, IOS, Linux, Microsoft, Wind River, TI, etc.
  - **Platforms**: ARM, MIPS, Broadcom, Freescale, IBM, Microchip, Renesas, Samsung

- **Semiconductors (ICs)**: Across segments, including Analog, Mixed signal, Memory, SOC, FPGA, IP, RF
Performance benchmarking – Creates a productivity baseline to enable internal and industry benchmarking

Performance benchmarking

Create a project-level productivity baseline based on recent projects, and benchmark across multiple dimensions against a database of ~2,000 IC and 1,700+ SW projects

**Schedule risk due to unrealistic productivity assumption**

Unrealistic productivity assumed for new project
Project planning – predictive analytics is used to optimize schedule and staffing at the project and portfolio levels

“What-if” scenarios to determine tradeoffs and optimize the plan

- Planned staffing plan is plotted against the predicted resource requirements to identify gaps
- “What-if” scenarios can be run to better understand tradeoffs between specifications, resources, budget and timeline, and to determine the optimal plan for the project

Analytics on required staffing and available resources across multiple projects

- Estimated staffing requirements by role and project phase across multiple projects is compared to available resources
- Resource gaps and bottlenecks are identified early on with plenty of time to adjust staffing levels, modify scope or reprioritize projects

How can I improve time to market and increase visibility across the product road map?

1 R&D Capacity is measured as “complexity units per person-week”

2 Schedule Slip is the amount of schedule overrun, expressed as a % of the original schedule.

(e.g. if a 100-week project slips 12 weeks, then schedule slip = 12%)
There are several ways to engage Numetrics

<table>
<thead>
<tr>
<th>Scope</th>
<th>Engagement model</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Analytics focused diagnostic</strong></td>
<td>▪ Numetrics team handles data entry, validation, analyses, and reports</td>
</tr>
<tr>
<td>▪ 4-6 week (depending on data availability), <strong>Numetrics led diagnostic</strong></td>
<td>▪ Client collects required project data under Numetrics’ guidance and support</td>
</tr>
<tr>
<td>▪ Standalone analytic assessment of 5-7 completed projects</td>
<td>▪ Numetrics team handles data entries, validation, analyses, tailored benchmarking and reports</td>
</tr>
<tr>
<td>▪ Provides a productivity baseline, industry benchmarks and analytic root cause analysis</td>
<td>▪ Client collects required project data with Numetrics’ guidance</td>

<tr>
<td>▪ 8-10 weeks <strong>deep diagnostic, combining analytic and qualitative analyses</strong></td>
<td></td>
</tr>
<tr>
<td>▪ Includes <strong>analytics focused diagnostic, complemented by qualitative tools</strong> such as surveys, project deconstruction, process mapping, interviews and workshops to provide a complete view of productivity and performance drivers</td>
<td></td>
</tr>
<tr>
<td>▪ May include <strong>planning of a new project</strong> to determine required resources and schedule risk</td>
<td></td>

<tr>
<td>▪ Embed Numetrics planning tool in the standard PD process to <strong>continuously track performance</strong></td>
<td></td>
</tr>
<tr>
<td>▪ Use predictive analytics to <strong>increase TTM transparency and optimize resource allocation</strong></td>
<td></td>
</tr>
<tr>
<td>▪ Includes initial benchmark and baseline creation and access to the planning tool</td>
<td>▪ Client trained to input project data and run reports directly using the web interface</td>
</tr>
<tr>

BENCHMARKING AND ROOT CAUSE ANALYSIS

Benchmarking and root cause analysis require project data and timelines of several completed projects

<th>Activities</th>
<th>1 Data collection</th>
<th>2 Complexity and Performance calculation</th>
<th>3 Benchmarking</th>
<th>4 Root cause analysis and recommendations</th>

<tbody>
<tr>
<td>▪ Identify projects and data providers (often a project/program leader who solicits input from internal project records, architects or developers)</td>
<td>Numetrics calculates complexity and performance metrics, such as: ▪ Design complexity ▪ Total duration and phase durations ▪ Total effort and phase effort ▪ Schedule slip ▪ Development productivity ▪ Development throughput ▪ Cost per complexity unit and total cost ▪ Reuse and reuse leverage</td>
<td>▪ Numetrics identifies a peer group of projects, as similar as possible to client projects ▪ Client performance is compared to the peer group, differences are highlighted using a variety of analytic tools and techniques including: – XY scatter plots – Radar charts – Tabular data – Phase charts – Histograms</td>
<td>▪ Analytic tools search for root causes for areas of high and low performance (identify drivers of performance) ▪ Use best in class practices to determine recommended course of action ▪ Share results and discuss implications and opportunities for improvement</td>
<td></td>

Project Planning and Risk Analysis

Numetrics’ predictive analytics can help optimize project planning and timely execution.

### Baseline Performance
- **Past performance** across a range of projects is assessed to build a performance baseline for the organization.

### Input Project Data
- New project characteristics (e.g., # features, re-use, platform) and constraints (e.g. resources) are captured.

### Calculate Complexity
- **Numetrics’ complexity engine**, calibrated by a set of industry wide projects, estimates the complexity of the project.\(^1\)

### Estimate Project Plan
- **Prediction engine** estimates resource and schedule plan based on past performance, project data and complexity.

### Identify Risks in Current Plan
- Identify resource and schedule risks based on a comparison of predicted plan and project expectations or existing plan.

#### Schedule & Resource Estimation
- **Development Productivity**
  - **Complexity Units/Person-week**

#### Schedule Risk Analysis
- **Schedule Risk**
  - **No. of Full time Equivalents (FTEs) in Peak phase**

---

\(^1\) Measured in Complexity Units - A metric reflecting the amount of effort the average development team will spend on the project.

Numetrics is a well-established company with a field proven sets of solutions.

- **1998** Launch of semiconductor predictive planning solution
- **2001** Launch of semiconductor benchmarking solution
- **2004** First embedded SW complexity model
- **2006** Launch of embedded SW predictive planning solution
- **2010** First 1,000 SW projects released in industry database
- **2013** Numetrics acquired by McKinsey

- Extensive database of ~2000 IC and ~1700 SW projects
- Field proven complexity estimation and predictive analytics algorithms
- Wide industry coverage including automotive, aerospace & defense, high tech, financial services, medical, etc.
The Numetrics database includes more than 140 MedTech SW projects...

Numetrics database - MedTech

- More than 140+ medical SW projects
- Applications include:
  - Anesthesia
  - BioSurgery
  - Patient bio-system monitoring
  - Medical imaging
  - Blood/body fluid management
  - Patient information management
  - Doctor diagnostic assistance tools
  - Medical imaging analysis
  - Remote equipment monitoring & information dashboards
- Spans drivers + operating system/middleware + UI/application layer
- Team sizes from 2 to >75 FTEs
- Recent data (<3-4 years)

Sample Project Descriptions

- “Medical Neurodiagnostic product”
- “Embedded control and GUI for dialysis machine”
- “Patient Respiratory Monitoring System”
- “Cardioverter defibrillator”
- “ECG monitor”
- “Blood cell count monitor”
- “Controls; samples and displays fresh gas flow for medical anesthesia equipment.”
- “SW for operation of an ophthalmic surgical instrument”
- “Medical ultrasound imaging & associated equipment”
- “Infusion pump software including drug library; user interface; sensor monitoring and fluid propulsion control”
- “firmware and software for an IVD instrument.”
- “SW for analysis, comparison, and visualization of genomic sequencing data”
- “Patient Respiratory Monitoring System”
- “Remote medical equipment monitoring, control and alarm notification system”
Numetrics’ analytics engine is based on a proprietary “design complexity” model that normalizes productivity across projects.

**Design/development complexity:**
- A metric representing the total amount of project effort the average design/development team in the industry would expend on the project—quantifies the true, normalized output of the design team.
- The complexity model fully takes into account the stochastic nature of product development, which enables the predictive analytics engines to reliably estimate schedule & resource requirements and perform meaningful comparisons of performance metrics across different projects/designs.
